

RESOLUTION OF THE
RESOURCES AND DEVELOPMENT COMMITTEE
24th Navajo Nation Council --- Second Year, 2020

AN ACTION

RELATING TO RESOURCES AND DEVELOPMENT: AMENDING AND UPDATING THE
NAVAJO NATION'S NATURAL HERITAGE PROGRAM ENDANGERED SPECIES LIST

BE IT ENACTED:

SECTION ONE. AUTHORITY

- A. The Resources and Development Committee of the Navajo Nation Council exercises oversight authority over wildlife on the Navajo Nation. 2 N.N.C. § 500(C).
- B. The Navajo Nation Criminal Code protects wildlife, endangered species in particular, on the Navajo Nation. 17 N.N.C. § 507.
- C. The Resources and Development Committee of the Navajo Nation Council is charged with developing a list, by regulation, of those species and subspecies of wildlife indigenous to the Navajo Nation which are determined to be endangered within the Navajo Nation giving their common and scientific names by species and subspecies. 17 N.N.C. § 507(A).

SECTION TWO. FINDINGS

- A. The Navajo Natural Heritage Program is tasked with maintaining and managing the Navajo Endangered Species List (NESL) as one of its responsibilities under contract with the Department of the Interior, Bureau of Indian Affairs.
- B. Under the Navajo Nation Criminal Code wildlife on the Navajo Nation, endangered species on the NESL in particular, are protected. 17 N.N.C. § 507.
- C. The Resources and Development Committee of the Navajo Nation Council is charged with developing a list, by regulation, of those species and subspecies of wildlife indigenous to the Navajo Nation which are determined to be endangered within the Navajo Nation giving their common and scientific names by species and subspecies. 17 N.N.C. § 507(A).

- D. The Navajo Natural Heritage Program has submitted an updated Navajo Endangered Species List. See **Exhibit A**.
- E. The Resources and Development Committee of the Navajo Nation Council finds it to be in the best interest of the Diné to approve the updated Navajo Endangered Species List as submitted by the Navajo Natural Heritage Program and as found at **Exhibit A**.

SECTION THREE. APPROVAL

The Resources and Development Committee of the Navajo Nation Council hereby approves the updated Navajo Endangered Species List as submitted by the Navajo Natural Heritage Program and as found at **Exhibit A**.

CERTIFICATION

I, hereby, certify that the following resolution was duly considered by the Resources and Development Committee of the 24th Navajo Nation Council at a duly called meeting at the Navajo Nation Council Chambers, Window Rock, Navajo Nation (Arizona), at which a quorum was present and that same was passed by a vote of 5 in favor, and 0 opposed, on this 13th day of January 2020.

Rickie Nez, Chairperson
Resources and Development Committee
of the 24th Navajo Nation Council

Motion: Honorable Mark A. Freeland
Second: Honorable Thomas Walker, Jr.

Chairperson Rickie Nez not voting.

EXECUTIVE SUMMARY

UPDATE TO THE NAVAJO ENDANGERED SPECIES LIST

April 10, 2019

The Navajo Natural Heritage Program is tasked with maintaining and managing the Navajo Endangered Species List (NESL) as one of its responsibilities under a BIA 638 contract. The NESL is codified under Title 17 of the Navajo Nation Code and any changes to the NESL are subject to the review and approval of the Resources and Development Committee of the Navajo Nation Council.

Attached are the Natural Heritage Program's proposed updates to the NESL for 2018. The proposed changes include the removal of seven species from the NESL, the change of status for two species to "extirpated", the update or change of name to three species, and the uplisting of three species to "endangered" or "threatened" status. The species being removed from the list or relisted as extirpated will no longer be required to be considered under the biological clearance process (The Black-footed Ferret will need to be considered if a recovery population is established by the Navajo Nation, if Ferrets migrate on to Navajo Nation from some future recovery site, or in the unlikely event that a previously undiscovered population were found). One species of fish and two species of plants will be receiving protection under the NESL and new survey and avoidance recommendations will be included in the NESL species accounts following the adoption of the 2018 NESL.

Included in this document are the following:

- 1) The updated NESL reflecting the proposed changes (this is the document that will become the new NESL)
- 2) ****Reference or supporting documents***
 - a. The current (2008) NESL with proposed changes identified in red
 - b. The justifications for each proposed change to the NESL organized by species
 - c. Correspondence from relevant biologists or agencies that have reviewed and comment on our proposed changes.
 - d. A copy of the Department of Fish and Wildlife's Fisheries Management Plan, which addresses management of the Zuni Bluehead Sucker on the Navajo Nation.

NAVAJO ENDANGERED SPECIES LIST – May 2008 Scientific name Common name

<i>Sauromalus ater</i>	Chuckwalla

FISHES

PROPOSED PLANT CHANGES TO THE NAVAJO ENDANGERED SPECIES LIST

April 2018, Chad Smith, NNHP Zoologist

A. STATUS CHANGES OF NESL-LISTED SPECIES

1. *Catostomus discobolus*- Bluehead Sucker and Zuni Bluehead Sucker

PROPOSED ACTION: **ADD SUBSPECIES *JARROWII* TO NESL G2**

Justification:

The Zuni bluehead Sucker was listed as a federally endangered species in 2014 (79 FR 43131 43161) and several populations are known to occur on the Navajo Nation. Prior to the federal listing decision, the extent and distribution of this subspecies was poorly understood and we were unsure if any of our Bluehead Sucker populations shared the genetic and phenotypic traits that existed in Zuni Bluehead Sucker populations in the Zuni River system. During this time, we listed all populations of the Bluehead Sucker as a G4 species in need of further study. As part of the effort to sort out the status of this species our department provided fish samples from several of our creeks for use in genetic and morphological research. The results of that research indicate that the populations of bluehead sucker on drainages of the LCR are Zuni Bluehead Suckers and the populations of Zuni Bluehead suckers in our headwater streams in the San Juan Basin are not. We are recommending the up-listing of Bluehead Suckers from the LCR headwater streams on Navajo Nation as an endangered species under the subspecies designation *Catostomus discobolus jarrowii*. We intend to leave the populations of Bluehead Sucker in other drainages on the G4 list until we are able to determine their genetic distinctiveness relative to other San Juan basin populations.

2. *Mustela nigripes*- Black-footed ferret

PROPOSED ACTION: **MOVE SPECIES FROM G2 (ENDANGERED) TO G1 (EXTIRPATED)**

Justification:

The Black-footed ferret has not been confirmed as present on the Navajo Nation in over 30 years. The last confirmation of ferrets on Navajo Nation was a jaw bone found in association with an archeological dig in the 1980's. Since that time a handful of sightings have been reported but follow-ups have failed to confirm evidence of ferrets. Over the last 15 years the Navajo Nation has experienced protracted drought, over grazing, and poor range management, all of which has contributed to the loss of prairie dog habitat. In addition, significant losses of prairie dogs have been documented on the Arizona portion of the reservation north of I-40 and New Mexico portion of the reservation along the hwy 491 corridor among other places. Some of those losses are likely the result of sylvatic plague events that have occurred in the last decade. Ferrets and prairie dogs are susceptible to plague and the likelihood of continued persistence of unknown remnant populations of ferrets is unlikely without intensive plague management. In addition to plague, ferrets are highly susceptible to diseases that occur in domestic and wild canids, such as distemper. The Navajo Nation continues to struggle with the management of very large free roaming and poorly managed domestic dog populations. Dogs on the Navajo Nation often breed in an unmanaged way and rarely receive managed veterinary care or vaccinations for common canid diseases. As a result, both distemper and parvo are prevalent in the local domestic dog population and the mobile and unrestrained nature of the dog population increases the likelihood that those diseases would

have come into contact with wildlife. The documented losses of prairie dogs, presence of plague, and presence of large populations of un-vaccinated dogs makes it highly unlikely that undetected ferret populations have survived to present day on the Navajo Nation. If a remnant population is found, or if the Navajo Nation decides to engage in ferret recovery through reintroduction, the Navajo Natural Heritage will adjust the listing of this species appropriately.

B. ADDITIONS TO NESL

No animals

C. DELETIONS FROM NESL

1. *Ovis canadensis*- Bighorn Sheep

PROPOSED ACTION: REMOVE FROM NESL GROUP 3

Justification:

The Bighorn Sheep is a wildlife recovery success story on the Navajo Nation. We initiated recovery of the species from a few individuals in the gorge of the San Juan River in Utah. Nearly 30 years after initial recovery efforts, we now have three distinct herds and the population is able to sustain small amounts of managed hunting. Bighorn Sheep hunting is currently paying for much of the management and recovery effort directed at this species and we anticipate that funding and management opportunities will improve over time. While this species is still sensitive to a number of threats (especially domestic livestock diseases) we believe the species is recovered to the point that protection under the NESL is no longer needed. This bighorn sheep will continue to be carefully managed and monitored by the department of fish and wildlife and we continue to work closely with tribal veterinarians, and state agencies to maintain the health and vitality of this Bighorn Sheep population.

2. *Falco peregrinus*- Peregrine Falcon

PROPOSED ACTION: REMOVE FROM NESL GROUP 4

Justification:

The Peregrine Falcon was listed as a federally endangered species in 1970 (35 FR 6069), and delisted due to recovery in 1999 (64 FR 46543 46558). We continued to protect the species under the NESL as it recovered on the Navajo Nation. When we delisted the species from its threatened status we moved it onto the G4 list of the NESL. The G4 list is intended for species that we believe are of conservation concern but are lacking enough information to determine status. Since we determined that the status of the Peregrine Falcon was secure enough to remove from the threatened list, we should not have placed it back onto a list for species with limited information. The Peregrine Falcon continues to recover on the Navajo Nation and we continue to monitor its nesting presence as part of our raptor monitoring programs. This species is now present in appropriate habitat throughout the extent of the Navajo Nation, and is still protected and managed under the migratory bird treaty act. The Natural Heritage program will continue to track this species as a species of conservation interest.

3. *Cottus bairdii*- Mottled Sculpin

PROPOSED ACTION: REMOVE FROM NESL GROUP 4

Justification:

The mottled sculpin is a fish species present in the San Juan River and its tributaries as well as other river systems in North America. It prefers clear rocky stream habitat in the headwaters of river systems. While present in the San Juan River and its tributaries, the Navajo Nation appears to have minimal suitable habitat for the mottled sculpin. Most of the Navajo portion of the San Juan River consists of heavily silted water that is not ideal for sculpins. Extensive fish survey work in the San Juan River indicates the fish is rarely encountered in the Navajo reach of the river, which is likely due more to habitat unsuitability than to declines in sculpin populations. Our department does not believe that the Navajo Nation currently has enough suitable sculpin habitat to provide meaningful conservation for this species. We also expect that continued native fish recovery efforts undertaken by the Tribes, BOR, USFWS, and States will benefit sculpins along with the endangered fish those management efforts are targeting.

4. *Lontra canadensis*- American River otter

PROPOSED ACTION: REMOVE FROM NESL GROUP 1, ADD TO NESL GROUP 4

Justification:

The American River Otter was extirpated from the Southwestern United States in the early 20th century. The species used to live in all major river systems in the southwest, including the San Juan and Colorado rivers on the Navajo Nation. In recent years several attempts have been made to reintroduce otters in New Mexico, Colorado, and Utah. Colorado introduced otters into tributaries of the San Juan River and Utah introduced them into tributaries of the Colorado River. Over time those otter populations have expanded such that we are confident that otters are now regular though rare residents of Navajo Nation waters in the San Juan River. Otters have been known in the San Juan and its tributaries in the vicinity of Navajo Lake for more than ten years. On Navajo Nation, otters have been observed as far downstream as the Shiprock area and river rangers have reported (though not confirmed) otter sightings in the Utah portion of the River. We believe our observations provide enough information to confirm that otters should no longer be considered extirpated on the Navajo Nation, though we are currently unable to judge the size or status of otter population. We expect that the recovery of otters will continue in the San Juan and Colorado river systems over time and we will continue to monitor otter presence on the Navajo portion of the river. Because we are uncertain of the number of otters currently using Navajo Nation portions of the river we are proposing to move the otter to our candidate list until a more thorough monitoring effort can be completed. As G4 species, the otter will not receive formal legal protection by the NESL but we will continue to seek data until a status decision can be made. The Natural Heritage Program will also recommend that the otter be excluded from our list of trappable furbearers until the population is robust enough to sustain management as a game species (should such management ever be desired or required).

D. NAME CHANGES

1. *Speyeria nokomis*- Western Seep Fritillary

PROPOSED ACTION: CHANGE COMMON NAME TO "GREAT BASIN SILVERSPOT"

Justification:

The *Speyeria nokomis* complex contains several subspecies and they are often referred to under

varying common names. The populations that we currently protect are the *nokomis* subspecies that is currently being considered for federal listing by the USFWS. While the species is referred to interchangeably by at least three common names we are proposing to update the common name to the name currently being used by the USFWS in any of its documents referencing this species. By referring to the species by the same common name we will create less confusion in our interactions with federal agencies as the conservation needs of this species are realized.

PROPOSED PLANT CHANGES TO THE NAVAJO ENDANGERED SPECIES LIST

April 2018, Nora Talkington, NNHP Botanist

A. STATUS CHANGES OF NESL-LISTED SPECIES

1. *Aliciella formosa* - Aztec gilia

PROPOSED ACTION: **CHANGE FROM NESL GROUP 4 TO NESL GROUP 3**

Justification:

Aliciella formosa is only known from 4 clustered populations on the Navajo Nation, 3 of which have not been re-surveyed in the last decade. Population sizes from the last survey date range from 70 to several hundred individuals, clustered locally and largely scattered within potential habitat. It is restricted in range to northern San Juan County, NM, and restricted edaphically to the Nacimient Formation, which is currently subject to intense oil and gas exploration. Research shows that transplanting and reseeding efforts are not successful for this species, making habitat preservation especially important.

2. *Cyrtopodium parviflorum* var. *pubescens*- yellow lady's slipper

PROPOSED ACTION: **CHANGE FROM NESL GROUP 4 TO NESL GROUP 1**

Justification:

Cyrtopodium parviflorum var. *pubescens* is only known from the Navajo Nation based on one herbarium collection that is approximately 30 years old. It not been observed on the Navajo Nation since that time. It is likely extirpated from the Navajo Nation, as the species is known to be intolerant of livestock grazing, which is a pervasive impact throughout the Navajo Nation. Furthermore, it is not likely that this species was ever common within the Navajo Nation; it has a widespread distribution across eastern and central North America, and is known as far west as the Rocky Mountains. The Chuska Mountains, along with the White Mountains in eastern Arizona, form the extreme western extent of this plant's range.

6. *Sclerocactus cloverae* ssp. *brackii*- Brack's hardwall cactus

PROPOSED ACTION: **CHANGE FROM NESL GROUP 4 TO NESL GROUP 3**

The Navajo Natural Heritage Program currently has only 1 record of Brack's hardwall cactus occurring on Navajo in the vicinity of Kutz Canyon, south of Bloomfield, NM. There are, however, 13 records of *Sclerocactus cloveriae* ssp. *cloveriae*, a closely related subspecies, occurring on Navajo and adjacent BLM lands southeast of Bloomfield, NM near Blanco Canyon. Taxonomic uncertainty between the two subspecies coupled with lack of adequate data about population size, threats, and species distribution have contributed to its current G4 status. We now know much more about the status and distribution of Brack's hardwall cactus across its range thanks to an extensive 2015 survey and report completed by the Natural Heritage New Mexico Program (Muldavin et al. 2016). The total geographic range of this species was identified as 55 miles north to south by 10 miles east to west at the widest point. It is confined to discontinuous portions of Nacimient formation in northwestern New Mexico. This

report identified 6 major subpopulations of Brack's hardwall cactus, which represent groups of potentially-interacting populations composed of many local populations (element occurrences). One of the 6 meta-populations, named Kutz-Angel Peak, occurs primarily on Navajo Nation land (stretching south of Bloomfield, NM to east of Huerfano, NM and west along the San Jan River). Within this meta-population there were 18 distinct populations and 1439 live plants (total for *ssp. cloveriae* and *brackii*) occupying 14981 ha of habitat. A major threat to this meta-population is exploration and development of oil and natural gas, of which Nacimiento formation is targeted. Activities related to oil and gas development and extraction have historically and are currently impacting Brack's hardwall cactus in the Bloomfield/Aztec region, an area densely developed with oil and gas-related infrastructure. Additional threats to this species include off-road vehicle traffic, livestock grazing, invasive species, rabbit and rodent predation, and cactus longhorn beetle infestation. Because of the limited range of this species, lack of high-quality populations, and extensive threats due to oil and gas activities, predation, trampling, and drought, Natural Heritage New Mexico has listed Brack's hardwall cactus as S2 (imperiled). Brack's hardwall also remains a BLM sensitive species. Based on data supplied by the NHNM survey and report, I proposed that Brack's hardwall cactus be uplisted from a G4 to a G3 species on the Navajo Endangered Species List.

B. ADDITIONS TO NESL

No plants

C. DELETIONS FROM NESL

***1. Amsonia peeblesii* – Peebles bluestar**

PROPOSED ACTION: REMOVE FROM NESL GROUP 4

Justification:

Amsonia peeblesii grows throughout the Little Colorado River drainage, from near St. Johns in Apache County to locations near the confluence with the Colorado River, making it a regional endemic. It has also been observed outside the Little Colorado River drainage, near Lee's Ferry. This species is not an edaphic specialist; rather, it thrives in a variety of edaphic and geologic environments, including cinders, clay-rich Moenkopi soils, Shinarump Conglomerate, and sandy soils. The Navajo Natural Heritage Program has 16 records of this species on Navajo, occurring south of Bitter Springs, AZ to north of Leupp, AZ. The species does not face any known threats that are significant in scale, broad in scope, or targeted at prime habitat. The fact that Peebles' Bluestar is not extremely rare, restricted in range or habitat, and faces few threats, justifies its removal from the Navajo Endangered Species List.

***2. Astragalus beathii* – Beath's milkvetch**

PROPOSED ACTION: REMOVE FROM NESL GROUP 4

Justification:

Astragalus beathii is a localized endemic that grows only in the immediate vicinity of Cameron, AZ. It is an annual to short-lived perennial plant which is adapted to disturbed environments such as wash bottoms and roadsides. Monitoring data collected from 2005 to 2011 shows that without a doubt this species forms viable long-term seed banks. These viable seed banks, combined with the mobile, high-connectivity nature of wash bottom habitats, allow populations to expand, contract, and migrate according to resource availability. *Astragalus beathii* is currently known from ten populations, but much of its habitat is located in remote areas north of the Little Colorado River Canyon, and remains unsurveyed. Six of the ten known populations were found in the last 3 years by Rich Crawford, a botany

student completing a floristic inventory of the Little Colorado Gorge. He discovered those populations while collecting from areas immediately adjacent to the canyon rims, and there are many acres of off-rim habitat that have not been explored. With the recent lifting of the Bennett Freeze, residential areas will undoubtedly be expanded in Cameron. However, the majority of housing on the Navajo Nation-even new housing-is dispersed 1 acre home-sites and not particularly threatening to this species, considering its preferred habitat of roadsides and wash bottoms.

3. *Ericameria arizonica* - Grand Canyon goldenweed

PROPOSED ACTION: REMOVE FROM NESL GROUP 4

Justification:

Ericameria arizonica is a Grand Canyon rim endemic. Its range extends 100 miles east to west, from the Little Colorado River to near Lake Mead in Mohave County. It is known from over 30 locations, despite the fact that many botanists are not inclined to take notice of and collect *Ericameria*. Although some tourist development may occur along the Little Colorado River within the foreseeable future, this development is not likely to be significant enough in scale, or broad enough in scope to threaten this species with extinction.

D. NAME CHANGES

Name from 2008 NESL:	Recommended Name for 2017 NESL:
<i>Lesquerella navajoensis</i> (Navajo Bladderpod)	<i>Physaria navajoensis</i> (Navajo Bladderpod)
<i>Zigadenus vaginatus</i> (Alcove Death Camas)	<i>Anticlea vaginatus</i> (Alcove Death Camas)
